The international standards organization, ASTM International, is seeking additional task group members to further develop the current terminology standard in industrial biotechnology (E3072-19). ASTM International develops and publishes voluntary consensus technical standards for a wide range of materials, products, systems, and services. Its sub-committee, E62.91 for Terminology in Industrial Biotechnology, is responsible for suggesting new terms and definitions to be added to the current standard and for revising existing terms and definitions as needed. The meanings and explanations of the technical terms have been written for both non-expert and expert users and is updated annually to include editorially any terms approved in the committees of technical standards. This standard, however, does not purport to address all of the safety concerns, if any, associated with the use of biotechnology products, materials, systems, or services. Interested parties should contact the sub-committee chair, Joseph McAuliffe, or the E62 staff manager, Pat Picariello, directly.
